

Partner Release Notes

People Intelligence.
Wherever You Are.

PeoplesHR v10.3

ABOUT THIS RELEASE

PeoplesHR is moving toward a vision where HR runs through intelligence and conversation. v10.3 upgrades the intelligence behind Lexi AI Insights and brings it to mobile. Lexi Super Agent has also been upgraded with the new MAO (Multi-Agent Orchestrator) model: a single agent now capable of handling requests across HR, PAY, and TIME in one conversation.

This release also introduces Payroll Pre-Processing Validation, Work From Anywhere with configurable geofencing, off-cycle payslip access, digital signing from Report Navigator, and a set of country specific compliance updates for Sri Lanka, Philippines, and Indonesia.

This document expands on the [customer-facing v10.3 release](#) notes with the configuration, scope, and implementation detail partners need for sales conversations, upgrades, and client rollout.

Each feature below is tagged with a Feature ID, for example Feature ID: 130496. These are PeoplesHR's internal tracking numbers, not customer-facing labels. They are included for ease of reference to a specific item when raising a question with your PeoplesHR contact.

RESOURCES

[PeoplesHR product documentation hub](#) *(for implementation)* Full technical documentation for every feature, including configuration guides and detailed specs. Use the Feature ID to find the matching article.

[PeoplesHR plans and capabilities page](#) *(for sales)* The full capability list and how features map to pricing plans. Useful when scoping a deal or positioning an upsell.

PEOPLES HR v10.3 FEATURE LIST

The table below is a summary of v10.3 update items, with its Feature ID for quick reference. Refer the relevant section for full details.

Click on a Feature item to jump to the relevant section.

Feature	Feature ID	Module	Description
Lexi AI Insights: Smarter, and Now on Mobile	130496, 125892, 134499, 123118	Insights	Faster, more accurate answers on web and mobile, with hierarchy-aware responses.
Lexi Super Agent: MAO Agent Update	130874	Insights	One agent handles HR, payroll, and time requests in a single conversation.
Enhanced Digital Signature Capability	75347	Insights	Sign reports directly from Report Navigator, no download-and-upload steps.
On-Demand Reports: Excel Download Update	112915	Insights	Excel version compatibility-only update, no change to data or workflow.
Off-Cycle Pay-Slips	76553, 76482	Pay	Employees can generate bonus, advance, and reimbursement pay-slips on web, mobile, and via Lexi.
Payroll Pre-Processing Validation	125212	Pay	Catches payroll data issues before a run starts, reducing rework and payroll errors.
Work From Anywhere (WFA)	123751	Time	Configurable location-based attendance control plus bulk location assignment.
Control Who Sees Your Surveys	124380	Engagement	Survey creators can restrict visibility to specific employees.
Copy a Survey in One Click	124379	Engagement	Faster survey setup by duplicating existing surveys.
Request Tracker: Notifications & Completion Notes	110918, 110917	Engagement	Clearer, color-coded status updates and completion evidence for every request.
Mobile App Offline Continuity	114433	Mobile & General	Employees can swipe attendance without connectivity; records sync automatically
Color-Coded Email Alert Notifications	109966	Mobile & General	Faster recognition of alert type without opening the email.
Attach Supporting Documents Against Fields (EIM)	95991	Mobile & General	Fewer steps to upload supporting documents on the Employee Information page.
Sri Lanka: Lump Sum APIT Tax Calculation	119026	Sri Lanka	More accurate lump-sum tax treatment for bonuses and termination pay.
Sri Lanka: Bank and Branch List Update	122267	Sri Lanka	Keeps payroll banking data aligned with the latest official directory.

Feature	Feature ID	Module	Description
<u>Philippines: BIR DAT File Submission</u>	124194	Philippines	Direct, validated statutory file generation for BIR submission.
<u>Philippines: Base Instance EIM Changes, Phase 1</u>	116712, 120668	Philippines	Aligns employee fields and terminology to local requirements (fresh instances only).
<u>Indonesia: JKK Employer Contributions</u>	113374	Indonesia	Automated, risk-based JKK contribution calculation.
<u>Indonesia: Coretax XML File Generation</u>	124194	Indonesia	Direct, validated statutory file generation for Coretax submission.
<u>Indonesia: Pay Item-wise Gross and Gross-Up Method</u>	124134	Indonesia	Per pay item tax treatment for more accurate Gross-Up handling.
<u>Service Consumption Dashboard: Token Tracking</u>	129232	Additional	Independent usage and threshold tracking for Lexi Mobile and AI Insights.
<u>Entrust MFA Integration</u>	132183	Additional	Adds a token-based verification step for mobile users who require MFA.
<u>Client-Specific Agent Customization</u>	128441	Additional	Each client controls chatbot agent availability and employee field visibility.
<u>Bangladesh: Grameen Phone SMS Gateway</u>	127345	Additional	Adds a Bangladesh-specific SMS gateway option for mobile OTP login.

INSIGHTS

Lexi AI Insights: Smarter, and Now on Mobile

Feature ID: 130496, 125892, 134499, 123118 | Insights / Lexi AI Insights

Lexi AI Insights gets a smarter model and a new mobile experience, with auto-saved conversation history, bookmarks, and hierarchy-aware answers.

AI Insights on the PeoplesHR mobile app

Prediction engine (130496): Prediction scoring logic has moved from LLM prompts into SQL stored procedures, computing per-employee scores and aggregates at the database layer. The LLM now only interprets, formats, and explains results rather than performing the calculations itself. This cut token usage by roughly 87%, removed context-window overflow risk, and improved response time and reliability. Useful context if a partner is fielding cost or performance questions from a client.

Conversation history and bookmarks (125892): Conversations auto-save on both web and mobile, with rename, search-by-title, bookmark/unbookmark, and delete. Inactive conversations age out based on the client's configured retention period. Worth confirming retention settings during rollout.

Hierarchy tier mapping (134499): Lexi AI Insights no longer assumes fixed labels like Department, Division, Section, or Unit. It now reads each client's own configured hierarchy structure and reflects those labels in its answers. This removes a class of technical change that previously had to be made per client when hierarchy naming didn't match the default.

Mobile (123118): Same question-and-answer capability as web, supporting both text and voice input, with the same access controls and data-scope rules enforced.

Model option (135898): A new, faster and more cost-effective AI model option has been added for Lexi AI Insights, alongside the existing model. Selection happens automatically behind the scenes; no separate configuration or naming is exposed to partners or clients.

Note: Lexi AI Insights features may be subject to additional licensing charges. Confirm entitlement with your PeoplesHR contact before positioning to a client.

SALES ANGLE

Lexi AI Insights : HR Intelligence on the Go

HR leaders carry workforce analytics and intelligence with them wherever they are, accessible from mobile, through a simple AI chat conversation. No waiting on a report to answer a simple question.

Lexi Super Agent: MAO Agent Update

Feature ID: 130874 | Insights

Employees, managers, and HR/admin users can now chat with a single, unified agent to get things done across HR, PAY, and TIME. No more selecting an agent before starting a conversation.

MAO Agent trace panel showing how a single agent resolves a request.

Role-based capability: Access is still gated by existing role permissions even though the agent is unified. For employees this covers leave, payslips, policies, benefits, and profile updates. For managers, team attendance and approvals. For HR/admins, employee records, org structures, and configuration. Worth walking clients through the role breakdown during onboarding so expectations match what MAO will actually surface for each user type.

Naming: Across all markets, Lexi Super Agent is the customer-facing product/feature name and should be used in all sales, marketing, customer, and partner communications.

MAO (Multi-Agent Orchestrator) refers to the underlying agent model that powers Lexi Super Agent. Use MAO only in technical or internal contexts where the underlying model is specifically relevant, such as in this document.

SALES ANGLE

A Front-Line AI Agent for Every Employee Query

HR teams have a front-facing AI agent that handles employee queries end to end: producing and sharing payslips, answering policy questions, and resolving the everyday requests that would otherwise tie up HR's time.

For employees, the experience is simple: just ask.

For later-stage discovery conversations: MAO (Multi-Agent Orchestrator) is the AI agent coordinating behind Lexi Super Agent. When an employee asks a question, MAO interprets the request and hands it off to the right specialist sub-agent, whether that's HR, Time, or Payroll, then assembles the response. The employee only ever sees one agent and one conversation; MAO does the coordination work invisibly across whichever systems the answer actually lives in.

Enhanced Digital Signature Capability: Report Navigator Phase 3

Feature ID: 75347 | Insights / Reports

Users can now initiate digital signing directly from Report Navigator. Select an eligible PDF report from My Reports, preview it, and send it for signing, instead of routing through Template Designer only.

Scope: This is Phase 3 of the Digital Signature capability. It's restricted to PDF-format reports where preview is enabled. The existing Digital Signature module still owns routing, signatory assignment, signature collection, and status tracking. This phase only adds the report-to-signature handoff, replacing the old download-and-upload flow.

SALES ANGLE

Sign Without Leaving the Report

No more downloading a report, signing it separately, and re-uploading. For clients who circulate signed reports regularly, such as board packs or compliance filings, this removes a manual step they're doing today.

On-Demand Reports: Excel Download Update

Feature ID: 112915 | Insights / Reports

Excel downloads for all On-Demand Reports have been updated to the latest supported file format for compatibility with current Excel environments.

Client impact: No change to report data, formatting, download behavior, or user experience. This can be communicated as a pure compatibility update. No retraining or workflow change needed.

PAY

Off-Cycle Pay-Slips Now Available

Feature ID: 76553, 76482 | Pay / Payroll

Employees can view, download, and access pay-slips for off-cycle or unscheduled payments (bonuses, mid-month salary advances, business expense reimbursements) through HR Self-Service, a dedicated External Pay-slip section on mobile, and by asking Lexi directly.

Terminology: Internally this was scoped as "External Process" pay-slip generation. That term should not appear in any client-facing material. Use "off-cycle or unscheduled payments" with the bonus, advance, and reimbursement examples.

Access model: The mobile External Payslip section and Lexi retrieval both reuse the existing payslip framework, so current permissions and view-only restrictions carry over automatically. No separate security configuration needed.

SALES ANGLE

One Place for Every Payslip

PeoplesHR generates and delivers every payslip an employee needs: regular salary, bonuses, mid-month advances, expense reimbursements, and other off-cycle payments, all self-service on web, mobile, or by simply asking Lexi. No more chasing HR admin for a payslip copy.

Payroll Pre-Processing Validation: Flag and Fix Payroll Errors Before They Run

Feature ID: 125212 | Pay / Payroll

A new Pre-Process Validation Framework catches payroll data issues before a payroll run starts, surfaced alongside the anomaly detection that runs during the payroll run itself.

Configuration: Validation rules are configurable per Pay Group, can be enabled or disabled individually, and are classified as Informational, Warning, or Blocker. They can be run manually (single or bulk), in real time from the dashboard, or on a schedule. Unresolved Blocker-level issues prevent payroll processing until reviewed and either resolved or explicitly accepted.

SALES ANGLE

Catch Payroll Errors Before Paychecks Go Out

For any prospect who's had a payroll rerun, a compliance fine, or an angry employee over a wrong paycheck, this is a direct cost-avoidance pitch, not a feature list item. Errors get caught before the run, not after.

TIME

Work From Anywhere (WFA)

Feature ID: 123751 | Time / EIM & Attendance

Employees can apply for WFO, WFH, or Anywhere arrangements by specific date through a color-coded calendar view, with leave, holidays, and rosters visible alongside. Organizations can also configure clock-in/clock-out location restrictions and assign work locations in bulk.

Migration note: The legacy Monday-to-Sunday WFO/WFH toggle grid is retired with this release. Existing data is migrated through a one-time script covering the remainder of the calendar year; dates beyond that migration horizon fall back at read time to a configurable tenant baseline arrangement. Plan a data/config conversation with clients ahead of upgrade.

Geofencing configuration: Inside-radius swipes can be set to straight approval or workflow approval. Outside-radius swipes can be set to straight rejection, system restriction (blocked with a message), or workflow approval. Configurable globally, enforced across biometric, web, and mobile channels.

Bulk location upload: Handles 1,000 to 2,000 rows per file via a validate-then-preview-then-save flow, with a downloadable error report for any rows that fail. HR can start from a blank template or pre-fill with selected employees.

SALES ANGLE

Make Hybrid Work Easier to Govern

Move WFH, WFO and work-from-anywhere arrangements out of emails, chats and spreadsheets. Employees can request where they'll work by date, while HR sets location rules, geofencing and approval controls, keeping flexible work organized and attendance accurate.

ENGAGEMENT

Control Who Sees Your Surveys

Feature ID: 124380 | Engagement / Survey Tool

Survey creators can now control which employees have access to manage a survey through the new Manage Survey Access option. This adds greater control over who can edit and administer individual surveys, while existing survey audience selection continues to determine who receives the survey.

Survey end dates can also be updated after publishing, without having to republish the survey.

Manage Survey Access option on the Create New Survey page.

SALES ANGLE

Better Control Over Survey Administration

Give the right people access to manage each survey without opening up editing rights more broadly. This makes it easier for HR teams to collaborate on surveys while maintaining clear control over who can make changes, particularly useful when multiple teams or stakeholders use the survey tool.

Copy a Survey in One Click

Feature ID: 124379 | Engagement / Survey Tool

Active or inactive surveys can be duplicated into a new draft ("Copy of [Original Survey Name]") carrying forward setup, audience, design, and logic, with start and end dates left blank. The duplicate is a fully independent survey once published. No responses, results, or history carry over from the original.

Request Tracker: Notifications and Completion Notes

Feature ID: 110918, 110917 | Engagement / Request Tracker

Automatic, color-coded email notifications now fire at every stage of a request: approvers when action is needed, owners when a request is ready to fulfil, and requesters on approval, rejection, completion, or forwarding. Request Owners can also add remarks and attach supporting documents when marking a request complete, visible to requesters on web and mobile.

Marking a request complete with remarks and an attachment.

MOBILE & GENERAL

Mobile App Offline Continuity

Feature ID: 114433 | Mobile

The mobile app now supports offline attendance swiping through device authentication, with records queued locally and synced/validated once connectivity and normal login are restored.

Offline Mode on the PeoplesHR mobile app

Scope: Currently limited to Mobile Swipe attendance actions. Users can see sync status and are notified if any offline record fails to process.

SALES ANGLE

Attendance That Works Even Offline

A strong pitch for clients with warehouse, factory floor, or field workforces where connectivity is inconsistent. Attendance still gets captured even when the signal doesn't.

Color-Coded Email Alert Notifications

Feature ID: 109966 | General

Base email alerts have been redesigned with a consistent header, body, call-to-action, and footer structure, and distinct coloring by status (pending, approved, rejected, general).

General, pending, rejected, and approved notification templates.

Migration approach: Legacy templates were converted via an AI-assisted transformation with manual governance, preserving all existing tokens and placeholders to avoid notification failures. Header and footer branding now resolves automatically through hierarchy-based configuration, including a configurable default hierarchy code. Useful for partners managing multi-entity or multi-brand clients.

Attach Supporting Documents Against Fields (EIM)

Feature ID: 95991 | General / EIM

Supporting documents can now be attached directly beside the relevant field on the Employee Information page, instead of through a separate attachments menu.

Framework: Built on a new reusable Field Attachment Framework (PHRFieldAttachment). EIM is the pilot module; the framework is intentionally designed for reuse across other modules in future releases. Supports draft uploads before an employee number exists, optional mandatory-attachment validation, and a scheduled cleanup job for abandoned drafts.

SALES ANGLE

Keep Employee Records and Evidence Together

Attach documents directly to the field they support, so HR teams can find the right information faster without searching through a separate attachments area. This keeps employee records more organised, contextual and easier to manage.

COUNTRY-SPECIFIC COMPLIANCE

Sri Lanka: Lump Sum APIT Tax Calculation

Feature ID: 119026 | Sri Lanka / Payroll

A more accurate method for taxing lump-sum payments (bonuses, termination pay), now extended to annual employees as well.

Method: The system calculates an Estimated Gross Annual Remuneration (EGAR) by combining actual earnings paid to date, forecasted future fixed salary and allowances, and cumulative lump-sum payments within the assessment year. The applicable APIT rate is derived from that projected annual income, with tax already paid accounted for before the final liability is computed. Users can also ask Lexi Super Agent directly about tax calculation and EGAR.

SALES ANGLE

More Accurate Lump-Sum Tax Calculations

Handle bonuses, termination pay and other lump-sum payments using a more accurate APIT calculation method that accounts for projected annual earnings. This helps Sri Lankan payroll teams calculate tax correctly and reduce the risk of discrepancies, rework and employee queries.

Sri Lanka: Bank and Branch List Update

Feature ID: 122267 | Sri Lanka / Payroll

Bank and branch master data has been reconciled against the latest official directory. New banks and branches were added and existing records updated, with existing employee banking assignments, payroll references, and history preserved and duplicates prevented.

Philippines: BIR DAT File Submission

Feature ID: 124194 | Philippines / Payroll

BIR DAT file generation for online submission to the Bureau of Internal Revenue, generated directly from payroll data, with preview and validation before the final file is produced.

Framework: Built on a shared, centralized File Generator Framework that also powers Indonesia's Coretax XML generation. Same validation, preview, configurable file naming, and user-group access control model across both.

SALES ANGLE

Simplify BIR DAT File Submission

Generate BIR DAT files directly from payroll data, with built-in preview and validation before submission. This helps Philippine payroll teams reduce manual preparation, catch issues earlier and make statutory filing more efficient.

Philippines: Base Instance EIM Changes, Phase 1

Feature ID: 116712, 120668 | Philippines / EIM

Employee data fields and terminology aligned to Philippines requirements: Race and Divorced Date hidden or removed, Personal Grade renamed to Salary Grade, address fields relabeled (Barangay, Subdivision/Village, City/Municipality), Free Zone renamed to Alien Card, a new GCash Number field added, and marital status options updated (Divorced removed, Widowed/Widower added, Unmarried renamed to Single).

Deployment scope: Phase 1 applies only to fresh Philippines instances, not upgrades. It deploys through environment provisioning rather than the standard upgrade path. Not yet included: Race, Electorate, DS Division, and GN Division still appear in the Reports module's Custom Filter Creation screen pending a future Reports-focused phase; Data Import templates and existing reports with these fields need separate updates; alert content has not been updated. Set client expectations accordingly if quoting this for an existing Philippines client.

Indonesia: JKK Employer Contributions

Feature ID: 113374 | Indonesia / Payroll

Risk-based JKK (Jaminan Kecelakaan Kerja) employer contributions are now calculated automatically based on each employee's assigned workplace risk level and applicable salary.

Configuration: Risk levels and contribution percentages are set up via User Defined Fields and assigned per employee through a configurable dropdown. The Pre-Process Validation framework (shared with Payroll Pre-Processing Validation) checks for missing or invalid risk assignments before payroll runs. Contribution amounts surface on pay-slips, payroll paysheets, and in AI Insights.

SALES ANGLE

Automate JKK Contributions Based on Employee Risk

Automatically calculate JKK employer contributions using each employee's assigned workplace risk level and salary. This helps Indonesian payroll teams apply the correct contribution rate consistently, reduce manual calculation effort and catch missing or invalid risk assignments before payroll is processed.

Indonesia: Coretax XML File Generation

Feature ID: 124194 | Indonesia / Payroll

Coretax XML files (BP21, BP26, BPA1, BPA2, BPMP) can now be generated directly from payroll data for submission to the Indonesian tax authority, on the same centralized File Generator Framework used for Philippines BIR.

SALES ANGLE

Generate Coretax Files Directly From Payroll

Create the required Coretax XML files directly from payroll data, helping Indonesian payroll teams reduce manual preparation and streamline statutory submission.

Indonesia: Pay Item-wise Gross and Gross-Up Method

Feature ID: 124134 | Indonesia / Payroll

Tax can now be calculated per pay item rather than treating an entire payslip as a single method. Employees on Gross can have individual pay items marked Gross-Up when the organization covers the tax; employees on Gross-Up have all pay items calculated as Gross-Up automatically.

Scope: This release covers monthly tax calculation only. Annual tax calculation (annualization) is explicitly out of scope for this phase, as the relevant business rules haven't been finalized, and will be addressed in a future release.

SALES ANGLE

More Flexibility in Gross and Gross-Up Payroll

Apply Gross or Gross-Up treatment at the individual pay item level instead of across the entire payslip. This gives Indonesian payroll teams more flexibility to handle mixed compensation structures accurately, such as a gross base salary with selected allowances grossed up.

ADDITIONAL TECHNICAL CAPABILITIES

The following are release-ready in v10.3 but were not included in the customer-facing release notes. They're primarily configuration, licensing, or market-specific items relevant to implementation and sales conversations.

Service Consumption Dashboard: Separate Token Tracking

Feature ID: 129232 | Additional / Licensing & Admin

Lexi Mobile and Lexi AI Insights are now tracked as separate consumption items in the Service Consumption Dashboard, each with independent usage tracking and threshold handling. One hitting its threshold no longer affects the other's status.

Note: Lexi AI Insights itself remains a single feature across web and mobile for seat allocation and access control purposes. This change is about consumption tracking, not the access model.

Entrust MFA Integration: PHR Web and Mobile

Feature ID: 132183 | Additional / Security

Adds an additional verification step during mobile login. After username and password, users who require Multi-Factor Authentication are prompted for a valid Entrust token before accessing the app. Users who don't require MFA are unaffected.

Relevance: Worth raising proactively with clients who have MFA requirements as part of implementation security scoping.

SALES ANGLE

Strengthen Mobile Login Security With MFA

Add an extra layer of verification for employees who require Multi-Factor Authentication on mobile. This helps organisations enforce stronger access controls for sensitive HR and payroll data, especially where internal security policies or regulatory requirements demand MFA.

Client-Specific Agent Customization and Field Visibility

Feature ID: 128441 | Additional / Configuration

Each client can now control which chatbot agents are available in their environment, toggle Employee Search on or off, and configure which employee information fields are visible in the employee side panel.

Relevance: This is a meaningful configuration lever for client onboarding. The chatbot also now supports client-specific field label mapping, so it correctly understands employee data even when a client uses non-standard field names.

SALES ANGLE

Configure the Chatbot Around Each Client's Needs

Control which chatbot agents are available, whether Employee Search is enabled, and which employee information fields can be displayed. This gives each client greater control over how the chatbot works in their environment and helps align the experience with their internal processes and data access requirements.

Bangladesh: Grameen Phone SMS Gateway for Mobile OTP Login

Feature ID: 127345 | Additional / Bangladesh

Mobile OTP login now supports multiple SMS gateway providers by client configuration, including a new Bangladesh Grameen Phone gateway integration, plus support for longer NIC value lengths.

Relevance: Flag for Bangladesh-market clients during mobile login configuration.

SALES ANGLE

More Reliable Mobile OTP Login in Bangladesh

Removes a real login friction point for Bangladesh-market clients whose employees use Grameen Phone. OTP delivery just works instead of failing silently on an unsupported carrier.
